

1. Biggest Challenge?

My biggest challenge was learning while doing and troubleshooting. I can't complain because this is great practice as I'll be doing this in industry. But, I also fell behind because of major or minor problems with one of my labs and it would take a long time to finish, causing me to fall behind.

2. Moment you were most proud of.

The moment that I'm most proud of is having the patience to work through the problems and figure it out. Also, I'm proud of myself for tackling and troubleshooting with grace even though.

3. One thing you would do to improve if you could do this all over again

One thing I would do to improve if I could do this all over again is to spend more time studying. That way I won't have to work too hard with basic troubleshooting as I'll already have an understanding of it. I did have to spend some time referencing things from previous courses (through the professors previous courses on her website)

4. One thing from term you could see yourself using in a job in the future

One thing from this term that I could see myself using in a job in the future besides Linux is using numerous sources for troubleshooting and using the things we used like Awk, Grep, Sed and of course working with numerous servers that do different things.

5. Did you improve the thing(s) you set out to improve since the midterm?

I did improve on the things that I set out to improve since the midterm, I reached out and went to office hours for help. Also, I used numerous resources and tried my best. I would still critique myself on time management though because it has improved but I know I can do better.
